**W**hat are  
intestinal worms?

Intestinal worms are parasites that thrive on nutrition from human intestines, which results in anemia, poor nutritional intake, and impaired growth.

The three most common types of worms are:

- Round worm
- Whip worm
- Hook worm

**All children will  
be dewormed on  
10 August 2018**

**17 August 2018 , mop-up day**

## How do worms spread?

Let's  
Learn

1

An infected child contaminates soil with feces containing worm eggs. These eggs develop into larvae in the soil

3

In an infected child, eggs and larvae develop into adult worms, which produce eggs and have an ill effect on the child's health

2

Other children are infected by eggs ingested through food or dirty hands, or by larvae penetrating the skin

All children who could not be dewormed on 10 August due to sickness or absenteeism will be dewormed on 17 August, mop-up day
